

Home Care Following Crown Prep and Placement

While wearing a temporary crown, avoid chewing on that side. Do not floss around the temporary crown to avoid it coming off. If your temporary crown does come off, please call the office.

When your permanent crown has been placed, continue to avoid chewing with and flossing that tooth for the first day. Please allow a full day for the cement to set. After this, you may resume normal chewing and flossing. No further special care is needed.
